1.Aim of the practical: Write a program based on logistic regression and make the sigmoid graph using sigmoid function in JupyterNotebook.

2.Objective: To implement and apply a regression algorithm on a given dataset in order to study the relationship between independent features and the target variable, and to evaluate the model performance using suitable metrics (like Mean Squared Error and R^2 score).

3.Algorithm/Flowchart:

```
import pandas as pd
import seaborn as sns
df=pd.read_csv('Social_Network_Ads.csv')
print(df)

df["Purchased"]=df["Purchased"].astype('category')
df["Purchased"]=df["Purchased"].cat.codes
print(df)

import matplotlib.pyplot as plt
from sklearn.model_selection import train_test_split
plt.scatter(df['Age'],df['Purchased'])
sns.regplot(x=df['Age'],y=df['Purchased'],data=df,logistic=True,ci=None)
x=df[["Age"]].values.reshape(-1,1)
y=df[["Purchased"]]
x_train,x_test,y_train,y_test=train_test_split(x,y,test_size=0.1)
from sklearn.linear_model import LogisticRegression
reg=LogisticRegression()
reg.fit(x_train,y_train)
reg.predict(x_test)
y_test=x_test*reg.coef_+reg.intercept_
print(y_test)

from scipy.special import expit
sigmoid=expit(y_test)
print(sigmoid)
```

4.Result/Output:

```
      User ID  Gender  Age  EstimatedSalary  Purchased
0    15624510    Male   19            19000          0

Learning outcomes (What I have learnt):

- Understood the concept of regression and how it helps in predicting continuous values.
- Learned to load and preprocess a dataset for regression tasks.
- Implemented **Linear Regression** using scikit-learn in Python.
- Evaluated model performance using metrics like **Mean Squared Error (MSE)** and **R^2 score**.
