1. **Aim/Overview of the practical**: Implementation of report in Tableau.

2. **Objective of the practical:** To implement and visualize data reports using Tableau for effective data analysis and insights.

3. **Implementation**

Step 1: Connect to Data Source

Open Tableau Desktop and connect to your data source. Tableau supports a variety of sources such as Excel, MySQL, Oracle, and CSV files. Import or connect live based on requirements.

Step 2: Explore and Prepare Data

Inspect and clean the dataset. Perform any necessary transformations like aggregations, calculated fields, or data blending to ensure data accuracy and readiness for analysis.

Step 3: Create Visualizations

Use Tableau's drag-and-drop interface to place dimensions and measures onto rows and columns. Create appropriate visualizations such as Clustered Bar Chart, Horizontal Bar Chart, Vertical Bar Chart.

Step 4: Add Filters and Parameters

Introduce interactivity by using filters and parameters. Filters allow users to narrow down data

views, and parameters enable user-controlled dynamic inputs.

Step 5: Design Dashboards

Combine multiple visualizations into a single dashboard. Arrange them using containers and enhance the layout with text boxes, legends.

Step 6: Format and Customize

Customize chart titles, Ensure visual clarity and maintain a consistent theme aligned with the purpose of the report.

4. Learning Outcomes:

- Gained hands-on experience in connecting and importing data from Excel into Tableau.
- Learned to create interactive charts, dashboards, and visual analytics.
- Understood how to interpret and present data insights visually for better decision-making.
