1. **Aim of the practical:** Create login, signup forms using different React controls.

2. **Objective:** Design and implement login and signup forms using various React controls for user authentication.

3. **Commands/Steps:**

Signup.jsx

```
 import { useState } from "react";
import "../styles/signup.css";

export default function SignupForm() {
  const [formData, setFormData] = useState({
    firstName: "",
    lastName: "",
    email: "",
    password: "",
    gender: "",
    userType: "User", // Default value
  });

  const handleChange = (e) => {
    const { name, value } = e.target;
```

```
    setFormData({ ...formData, [name]: value });
  };

  const handleSubmit = (e) => {
    e.preventDefault();
    console.log("Signup Form Submitted", formData);
  };

  return (
    <form onSubmit={handleSubmit} className="signup-form">
      <input type="text" name="firstName" placeholder="First Name"
value={formData.firstName} onChange={handleChange} required />
      <input type="text" name="lastName" placeholder="Last Name" value={formData.lastName}
onChange={handleChange} required />
      <input type="email" name="email" placeholder="Email" value={formData.email}
onChange={handleChange} required />
      <input type="password" name="password" placeholder="Password"
value={formData.password} onChange={handleChange} required />

      {/* ☑ Gender (Radio Buttons) */}
      <div className="radio-group">
        <label>Gender:</label>
        <label>
          <input type="radio" name="gender" value="Male" onChange={handleChange} required />
Male
        </label>
        <label>
          <input type="radio" name="gender" value="Female" onChange={handleChange} required
/> Female
        </label>
        <label>
          <input type="radio" name="gender" value="Other" onChange={handleChange} required
/> Other
```

```
      </label>
    </div>

    {/* ☑ User Type (Dropdown) */}
    <div className="dropdown-group">
      <label>User Type:</label>
      <select name="userType" value={formData.userType} onChange={handleChange}>
        <option value="User">User</option>
        <option value="Trainer">Trainer</option>
        <option value="Admin">Admin</option>
      </select>
    </div>

    <button type="submit">Signup</button>
  </form>
 );
}
```

Login.jsx

```
import { useState } from "react";

import "../styles/login.css";

export default function LoginForm() {

  const [formData, setFormData] = useState({

    email: "",

    password: "",

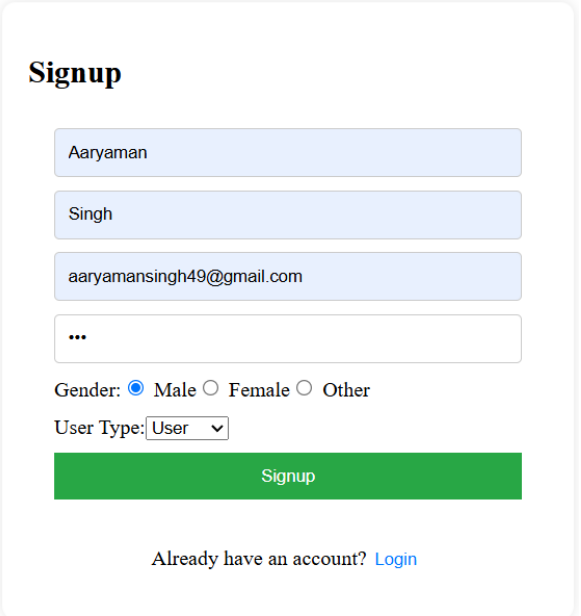
  });
```

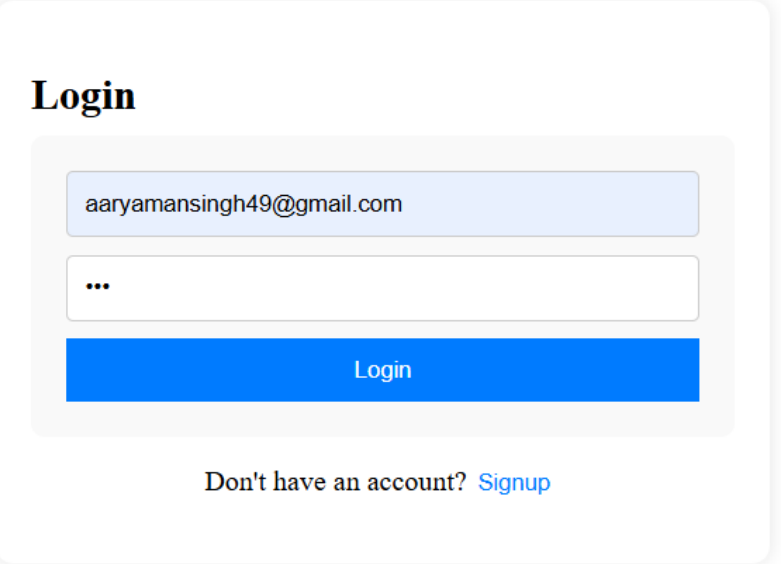
```
  const handleChange = (e) => {
    const { name, value } = e.target;
    setFormData({ ...formData, [name]: value });
  };

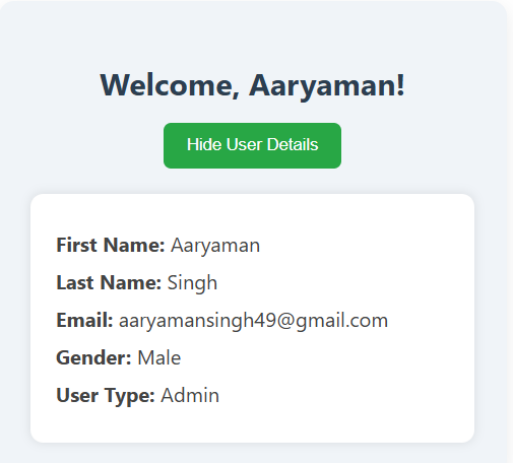
  const handleSubmit = (e) => {
    e.preventDefault();
    console.log("Login Form Submitted", formData);
  };

  return (
    <form onSubmit={handleSubmit} className="login-form">
      <input type="email" name="email" placeholder="Email" value={formData.email}
onChange={handleChange} required />
      <input type="password" name="password" placeholder="Password"
value={formData.password} onChange={handleChange} required />
      <button type="submit">Login</button>
    </form>
```

4. Result:







5. Learning Outcomes (what I have learned):

- Understand how to create and manage controlled/uncontrolled form components in React.
- Implement form validation and handle user inputs efficiently.
- Learn to use different UI controls (text fields, checkboxes, radio buttons, dropdowns) for a better user experience.
